Dataset

Description of data

- 
- ASX200 stock index
 - Data range 2002/9/24-2021/11/29
 - 66 stocks
 - 3496 trading days
 - 9 fields

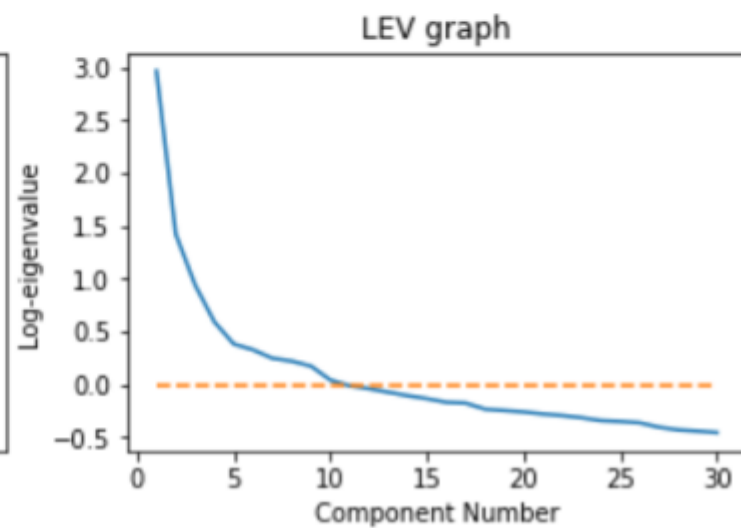

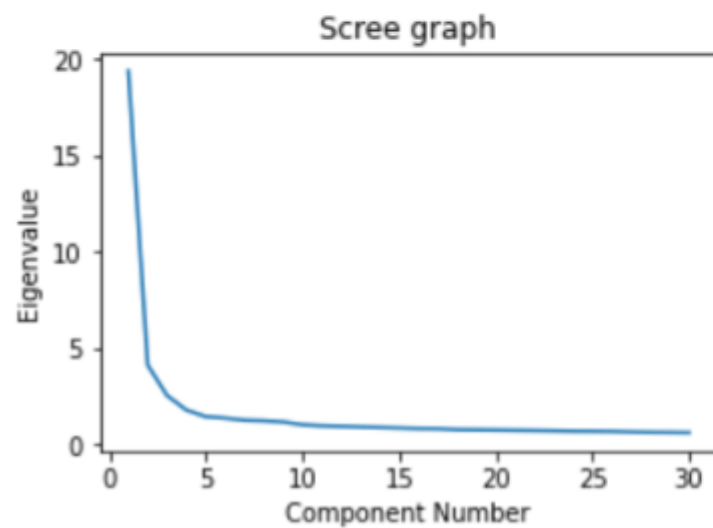

The component stocks of the ASX200 index

Industries	Number of stocks
Basic Materials	10
Consumer Goods	10
Financials	22
Health Care	6
Industrials	10
Oil & Gas	4
Technology	2
Telecommunicationss	1
Utilities	1

Choose number of components

Cumulative Variance

Kaiser's rule

Table 1. The 10 components with eigenvalue larger than 1

component	1	2	3	4	5
eigenvalue	19.41182993	4.141725196	2.559374381	1.802498243	1.46310926
component	6	7	8	9	10
eigenvalue	1.384663399	1.277892387	1.244037328	1.186395071	1.039942665

According to the above three strategies, we should retain **10** components.

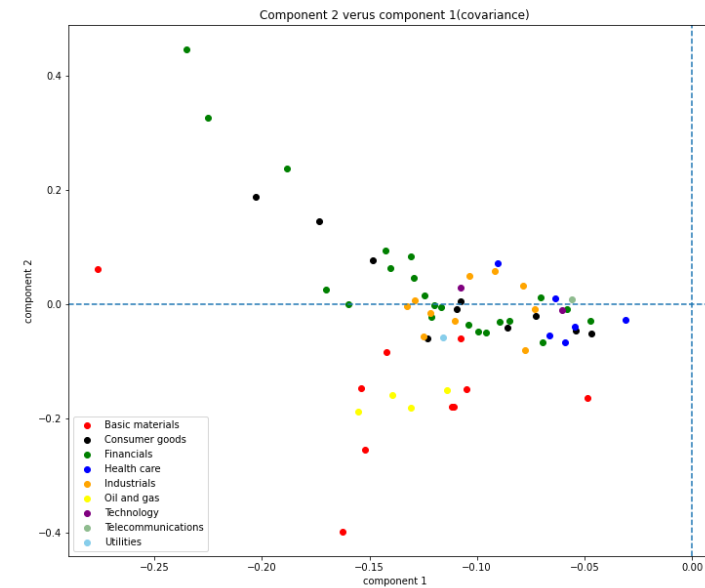

Eigenvectors of 10 components

Correlation

Covariance

Correlation

Covariance

Correlation

Covariance

We can find correlation is better than covariance, as the figures of components calculated by correlation matrix are more divergent.

Plots of principal portfolios

component5

component6

component7

component8

We can find that the portfolios generated by component3, component7, and component9 are relatively opposite trends from the others.

The performance of different portfolios

➤ $1/N$ —stocks (EWS)

➤ Risk Parity—stocks (RE)

➤ $1/N$ —principals (EWP)

➤ Risk Parity—principals (DRP)

stock portofilo results of different strategies

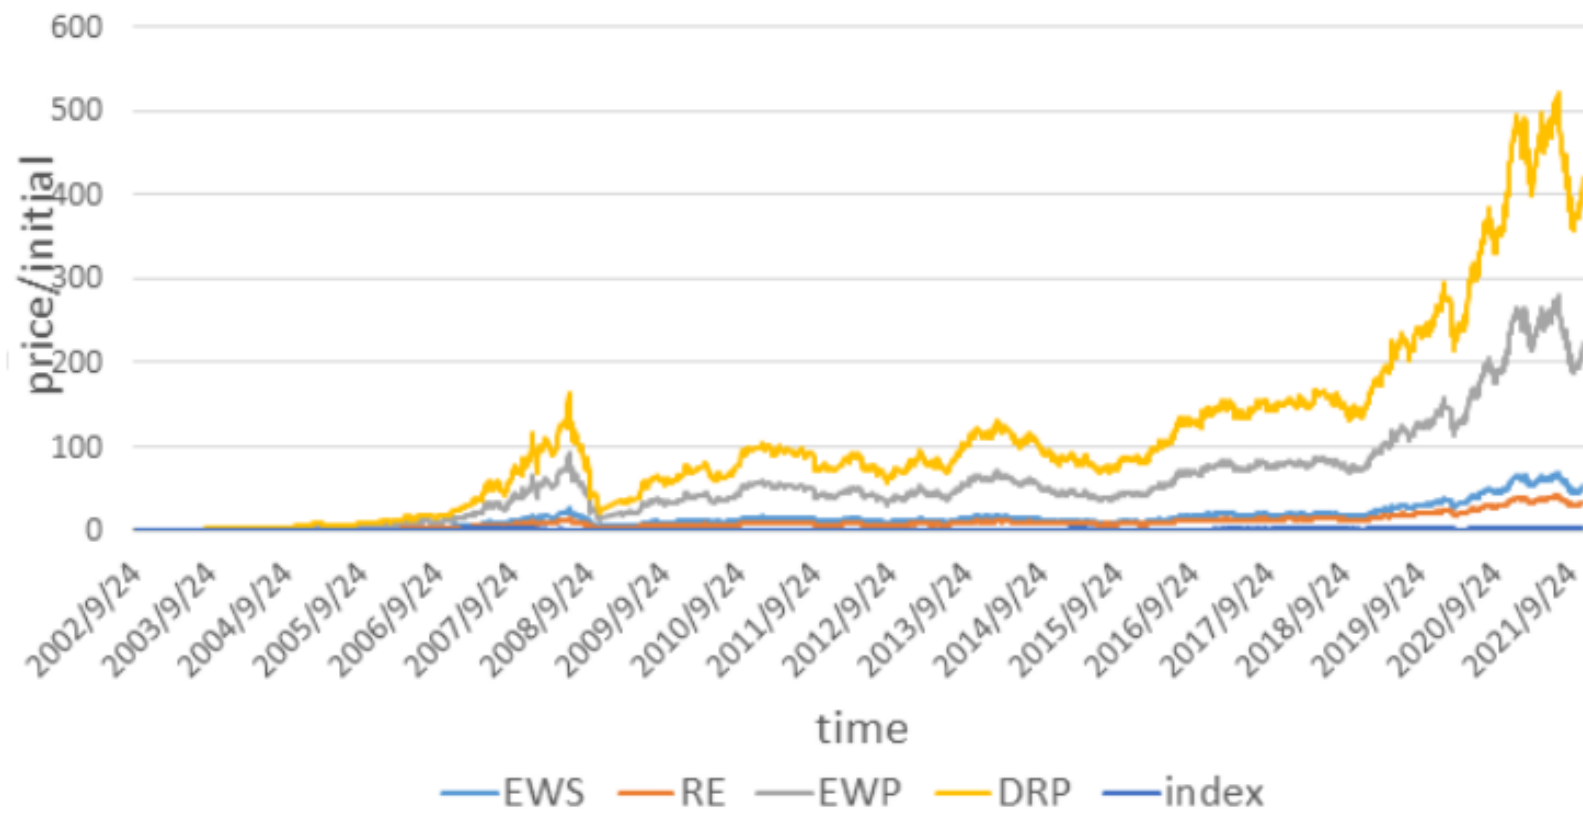

Table 2. Final gain, SD and minimum of the four portfolios.

Strategies	EWS	RE	EWP	DRP
Final gain	52.90	33.71	218.97	413.67
SD	0.86	0.80	0.93	0.94
Minimum	0.92	0.92	0.86	0.91
Sharpe ratio	-0.10612	-0.13139	-0.08092	-0.07207

The holding time is too long, which makes the Sharpe ratio to be less than 0 for all the strategies

THANK YOU!
